

EPICS AND USER STORIES

Issue	Summary	Description / User Story	Parent
SCRUM-10	Manage Blood Inventory	As a Blood Bank Manager, I want to record, update, and view blood component inventory by blood group, component type, quantity, collection date, and expiry date, so that I can maintain accurate and up-to-date blood stock information.	Blood Inventory Management
SCRUM-11	Identify Expired Blood Units	As a Blood Bank Manager, I want to identify expired or soon-to-expire blood units, so that I can remove unsafe units from available inventory and maintain blood safety.	Blood Inventory Management
SCRUM-12	Receive Expiry Warnings	As a Blood Bank Manager, I want to receive alerts when blood units are approaching their expiry date, so that I can take timely action to use or manage those units before they expire.	Blood Inventory Management
SCRUM-13	Create Emergency Blood Request	As a Hospital Staff Member, I want to create an emergency blood request with the required blood group, component type, and quantity, so that the blood bank can quickly respond to urgent patient needs.	Emergency Blood Requests
SCRUM-14	Validate Emergency Blood Request	As a Blood Bank Manager, I want to validate emergency blood requests, so that only legitimate and complete requests are processed for blood allocation.	Emergency Blood Requests
SCRUM-15	Match Compatible Emergency Donors	As a Blood Bank Manager, I want to match emergency requests with compatible donors based on blood group and availability, so that suitable donors can be identified quickly during emergencies.	Emergency Donor Matching & Notifications
SCRUM-16	Send Emergency Donor SMS Alerts	As a Blood Bank Manager, I want to send SMS alerts to compatible available donors, so that donors can be notified quickly when their blood is urgently needed.	Emergency Donor Matching & Notifications

SCRUM-17	Allocate Blood Units to Emergency Request	As a Blood Bank Manager, I want to allocate compatible blood units to approved emergency requests, so that hospitals receive the required blood safely and efficiently.	Blood Allocation & Inventory Safety
SCRUM-18	Prevent Duplicate Blood Bag Allocation	As a Blood Bank Manager, I want the system to prevent the same blood unit from being allocated to multiple requests, so that blood inventory remains accurate and duplicate allocations are avoided.	Blood Allocation & Inventory Safety

SCREENSHOT OF SPRINT CREATED

BURNDOWN CHART

SUMMARY

VIVA

1. Did your estimations reflect the actual effort?

Yes, overall the estimations were fairly accurate. The smaller tasks were easier to complete, while the more complex tasks, such as managing customer orders, required more effort. Using story points helped us compare the difficulty of each task before starting the sprint.

2. Was your backlog well-prioritized?

Yes, I think the backlog was well-prioritized. We gave higher priority to the main features that directly affect patients such as assigning blood bags and validating emergency blood requests. Less critical features were given lower priority so that the important work could be completed first.

3. How did your simulated sprint align with your plan?

The simulated sprint followed our plan quite well. We started with all the stories in To Do and then moved them to In Progress and Done as the work was completed. This helped us understand how tasks are managed during a real Scrum sprint and showed us how the planned work could be completed step by step.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart gave us a clear idea of how much work was completed and how much was still remaining during the sprint. It also showed that our team was able to handle the planned workload. By looking at the decrease in remaining story points, we could see our progress and get an idea of our overall capacity.
